Osijek area, Croatia

PROFILE

AI product engineer. I design LLM features around real business work and ship them by directing coding agents (Claude Code, Codex), with the evaluation, tests and review that make agent-written code safe to rely on; I own and can defend every architectural decision. I built Kokpit, a platform for car dealerships that runs my family's dealership and a public demo installation. Available for full-time remote work, with Croatian and EU work eligibility.

ENGINEERING EXPERIENCE

KOKPIT Founder and engineer. Platform for car dealerships — *SEP 2026 TO NOW*

- Designed the architecture: one Next.js core, a separate Postgres project and deployment per dealership; CI builds two tenants and proves no identity leaks between them.
- Directed coding agents across 4 apps, 8 packages and a Python service: 1,932 commits, 11,965 automated tests, 88 migrations. Runs one real dealership and a public demo installation.
- Specified a market valuation engine with no language model in the pricing path, and price-history compliance for a new Croatian consumer law.

KOKPIT ASSISTANT Tool-calling agent with human confirmation — *AUG 2026 TO NOW*

- Designed an agent whose write tools only create proposals; the database applies a change after a person confirms. Added a number guard, injection defence and pseudonymisation of personal data.
- Built its evaluation: 132 offline cases on every commit and 105 live cases; 104 of 105 passed (DeepSeek, November 2026) at about $0.0006 an answer. Found and repaired faults in the evaluation itself before tuning the assistant.

SHOWROOM AI photo studio, in development — *OCT 2026 TO NOW*

- Pipeline that replaces only the background of a car photo: BiRefNet and SAM 2.1 on a GPU through ONNX Runtime (Python), then a deterministic renderer with Blender scenes, golden-image tests and colour-fidelity checks.

AUTOMOBILI GALERIJA Live dealership site and back office — *NOV 2025 TO SEP 2026*

- Turned my family dealership's daily work into one system: catalogue, inquiries, trade-ins, offers, window stickers and feeds for five ad portals. In daily use.
- In-browser background removal with ONNX in WebAssembly; chose the model by measurement (edge agreement 0.874 to 0.974).

INTAKE EVAL Public LLM evaluation harness — *SEP 2026*

- TypeScript harness that validates structured model output and evidence quotes, with a browser playground, a failure lab and a human-review workspace. Results reproduce offline with one command.

OTHER EXPERIENCE

AUTOMOBILI GALERIJA Business operations and AI product development — *2021 TO PRESENT*

- Daily dealership work in stock, inquiries, trade-ins and sales; turned that into the requirements for the products above and own their direction.

HRVATSKI TELEKOM Sales and customer service agent — *SUMMER 2024*

- Explained service options to customers and regularly exceeded individual sales targets.

EDUCATION

FERIT OSIJEK Undergraduate Computing, Software Engineering track — *IN PROGRESS*

LANGUAGES

Croatian, native. English, C1 (advanced).

SKILLS

AI ENGINEERING	Tool-calling agents, LLM evaluation, prompt-injection defence, structured extraction, vision models, pseudonymisation, cost control
PLATFORM	TypeScript, Next.js, React, Postgres with row-level security, Supabase, Python, multi-tenant architecture, CI/CD
QUALITY	Vitest, Playwright, accessibility to WCAG AA, golden-image tests, security review
METHOD	Directing coding agents (Claude Code, Codex), specifications, decision records, second-model review

The code in these projects was written by AI coding agents under my direction. Figures measured 11 November 2026.
